

PROBLEM An analyst working a question pulls from filings, news, patents, job postings, and industry press, then sits down and figures out what it all adds up to. Any one of those sources is easy to read. Seeing how they connect is the hard part, and it's mostly done by hand. Existing tools show data, reports, and trends. They don't show how the pieces relate, or what's starting to take shape across them. KRYLO is testing whether that gap is a problem investment research and corporate strategy teams will pay to solve, especially where catching a developing relationship earlier changes a decision.	SOLUTION KRYLO pulls from many sources at once, finds the relationships between them, and shows what's forming around a company, market, or technology. Instead of reading twenty sources and connecting them by hand, an analyst sees a map of how the pieces relate. For example: KRYLO connected capital-market activity (financing, deployment, allocation) with media activity (coverage volume, sentiment) and surfaced a relationship neither domain had been asked about by name — attention concentrating around a capital event. An analyst would likely miss this, because capital and sentiment tracking are separate research tracks, run by different people or different tools and checked one at a time. KRYLO checks all fifteen domain pairs every cycle. That connection matters for judging how exposed a position is to sentiment-driven movement, which is easy to miss when nobody's job is to watch both at once. KRYLO has a working prototype today. The next step is finding out whether customers recognize the problem, trust the results, and will pay.	UNIQUE VALUE PROPOSITION KRYLO doesn't predict outcomes. It finds and maps how information is connecting — relationships and patterns that are hard to see when sources are read one at a time. The point isn't to tell someone what to believe. It's to make forming structure easier to see and easier to investigate. Unlike a search tool that answers one question and forgets it, KRYLO keeps the map. Work done on one question makes the next question in that domain faster, because the relationships are already there. The maps become an asset instead of a pile of one-off answers.	TARGET CUSTOMER PROFILES Initial focus: investment research and corporate strategy teams. Users Investment analysts and research professionals Corporate strategy professionals Intelligence, innovation, and technology research teams Buyers Heads of research Strategy leaders Corporate intelligence and innovation leaders Problem hypothesis: important connections are hard to see when information sits in separate places, leaving people to assemble and interpret it manually. The first release works from public and customer-supplied sources. Deployment inside an organization's own data comes later. Customer discovery will show which segment has the strongest problem, the best fit with how people already work, and the clearest willingness to pay.	CHANNELS & OUTREACH STRATEGY Customer development will be founder-led and narrow rather than broad. Direct outreach to investment, strategy, intelligence, and innovation professionals Warm introductions through professional networks Targeted prototype demonstrations LinkedIn, X, and relevant professional communities Industry conferences and analyst events Incubators and university business communities The goal isn't awareness. It's a handful of real validation relationships and one repeatable commercial use case.
OUTCOMES & SUCCESS MEASURES The immediate objective is external validation. Committed 40 customer discovery interviews 10 qualified external prototype demonstrations Documented evidence of whether users see practical value in what KRYLO surfaces A documented willingness-to-pay range A defined first commercial offering Target 2–3 design partners, drawn from the strongest customer relationships Design partners test KRYLO in real research work. They're validation relationships, not outsourced product development. Stretch 1 paid pilot A paid pilot is a stretch because procurement, contracting, and security review at institutions often run past 90 days.	STARTUP COSTS & REVENUE STREAMS Early funding supports customer discovery, prototype demonstrations, external validation, and building out the initial commercial model. Primary costs: Cloud infrastructure and data/API access Product development and testing Customer discovery and acquisition Legal, accounting, and business formation Security and operational requirements Revenue progression: paid pilots → annual B2B subscriptions or enterprise licenses → API access. Pricing gets established through customer discovery, not assumed up front.	90-DAY VALIDATION PLAN The four tracks run in parallel. Discovery conversations produce demonstrations, demonstrations produce design partners, and all three feed commercial validation throughout. Track 1 — Customer Discovery 40 structured conversations with investment research, corporate strategy, intelligence, and innovation professionals. What I'm after: the decision problems worth real money, where fragmented information hurts most, whether relationship mapping addresses a real gap, and which segment wants it most. Track 3 — Design Relationships 2–3 deeper relationships from the strongest conversations. Repeated testing against real research questions, testing whether KRYLO is useful, trusted, repeatable, and fits into real research work. Experiment Test whether repeated conversations and demonstrations reveal a concentrated set of decision problems where KRYLO's relationship mapping creates real value. The question isn't whether people like the interface. It's whether independent users spot useful connections they wouldn't have made on their own, and whether that's worth paying for. Track 2 — Prototype Validation 10 qualified external demonstrations. Testing whether users understand what they're looking at, whether the relationships are useful, whether KRYLO surfaces things they'd have missed, and whether it fits how they already work. Track 4 — Commercial Validation A realistic willingness-to-pay range, the strongest initial use case, the shape of the first paid offering, and what it would take to support a paid pilot.		
MARKET & PATH TO SCALE Initial market The initial market is investment research and corporate strategy teams that spend significant time pulling information together from different sources. We'll establish the size of that market over the next quarter using published industry data and customer discovery. We'll use comparable research and intelligence products as a starting point for pricing, then test those assumptions with customers. At contract values in the range those comparable products command, reaching \$2M in annual revenue means roughly 40 to 80 customers. Competitive intelligence, innovation, consulting, and API customers provide the room to grow past \$10M. How KRYLO scales Every engagement adds mapped relationships to a growing asset. Early work is founder-intensive. As the same patterns recur across customers and domains, more of each engagement becomes product instead of custom work. Commercialization progression COMMERCIAL RELEASE — Group Data. Direct product use creates and organizes the maps. This is the current stage. API PLATFORM — Transform Data. Validated capabilities exposed programmatically, so other systems can query KRYLO's maps without the full interface. INSTITUTIONAL ADOPTION — Embed Intelligence. KRYLO deployed inside an organization's own authorized data, where internal context and permissions sharpen what it can map. The current focus is the first stage only.				VISION Make it possible to see how information connects, before it's obvious in any single source. Operating sequence: prove the problem → prove the value → prove willingness to pay → make it repeatable → scale it. 1-year: a repeatable commercial use case, initial paying customers, and an economic model that works. 5-year: a platform delivering structural intelligence through direct product and API.
