

KRYLO - FORMAL PILOT EXECUTION

FORMAL PILOT EXECUTION

Pilot Domain: Technology Risk / Adoption Friction

This choice is now **authoritative** and part of the system of record.

✓ What “Technology Risk / Adoption Friction” Means (LOCKED)

The pilot will focus on recognition of:

- Misalignment between **declared technical strategy** and **lived developer / operator reality**
- Early signals of:
 - Tooling resistance
 - Operational brittleness
 - Adoption drag
 - Silent workarounds
 - Reversion behavior
- Friction that is **recognized but not escalated** due to:
 - Status pressure
 - Roadmap commitments
 - Political or organizational cost

This is **not** about:

- Performance metrics
- Uptime incidents
- Postmortems
- Feature success

It is about **pre-incident recognition**.

✓ Pilot Definition (FINAL)

1 Scope (NARROW BY DESIGN)

- Internal technical audience only
- One organization or program
- One major technical initiative or platform
- No cross-org aggregation

2 Signal Sources (R1-CONSISTENT)

- Passive exposure (impressions)
- Explicit recognition (single action)
- No comments
- No qualitative text

- No tagging or categorization

The system remains **agnostic to content**.

3 Cadence

- Snapshots generated:
 - Weekly or bi-weekly
- Bridge evaluation:
 - Offline
 - Deterministic
- Results reviewed by:
 - Architecture / Technical Strategy only

4 Success Criteria (LOCKED)

The pilot is successful if **any one** of the following occurs:

- A technical risk is surfaced **before** formal escalation
- A known but unspoken risk is validated
- The system correctly remains silent despite noise
- Leadership explicitly declines action based on clarity (still a success)

5 Exit Criteria

The pilot ends when:

- One eligibility event occurs **or**
- A predefined time window elapses (e.g., 8–12 weeks)

No extensions without reopening the lock.
