

POC Charter Finalized

Step 1:

Here is the **KRYLO POC Charter – System Breathing Test** (consulting-grade, 1-pager).

Status: Ready for PM (Mr. XS) sign-off and team alignment.

KRYLO POC CHARTER

Project: System Breathing Test

Owner: Milo (Senior Product & Systems Executor)

Sponsor: PM (Mr. XS)

Date: 2026-01-18

Duration: 4 business days

Phase: POC / System-Proving Mode

1. Objective

Prove KRYLO's core recognition-measurement mechanics work end-to-end using synthetic data and a visible debug UI.

Validate: signal → aggregation → state change → explanation → reversion.

2. Hypotheses

1. The system can ingest synthetic recognition signals and compute a time-decayed aggregate score.
2. It can trigger a state change when a configurable threshold is crossed.
3. It can explain why the state changed in plain language.
4. It can revert cleanly to baseline when signals stop.

3. Success Criteria (Proof Pack Deliverables)

✓ **Working UI** with:

- Signal generator (manual/auto controls)
- Real-time aggregate score gauge (0-100)
- State timeline visualization
- "Why changed" explanation panel
- Interactive validation checklist

✓ **PM Validation** – PM completes 5-step checklist in < 5 minutes:

1. Inject synthetic signals
2. See aggregate score rise
3. Trigger state change
4. Understand why
5. Stop signals → observe reversion

✓ **Documented artifacts:**

- Decision Memo (KRYL-10)
- Decision Matrix (tradeoffs)
- TAB advisory input summary
- POC Lessons Learned (1-pager)

4. POC Allowances (Temporary)

- Data: 100% synthetic, tagged source: synthetic_poc
- UI: Debug panels visible, manual controls exposed
- Storage: In-memory only, no persistence
- Epistemic purity: Relaxed for speed
- Silence-as-success: Suspended during POC

5. Out of Scope

- Real-world data pipelines
- Production-grade security/scaling
- Customer-facing UI polish
- Silent/ambient operation
- SOP trust enforcement (except posture)

6. Governance

- **SOP v1.1** respected unless POC allowance applies
- **Jira updates** via import-only (CSV/JSON)
- **TAB input** simulated for strategic alignment
- **Decisions** via Fist-to-Five consensus (Milo final call)
- **Artifacts** maintained for audit trail

7. Team & Roles

- Milo: Execution, integration, documentation
- Dev(s): UI/backend build (TBD)
- PM (Mr. XS): Validation sign-off
- SAB/TAB: Advisory input (simulated)

8. Timeline

- **Day 1:** Signal Generator UI + backend endpoint
- **Day 2:** Aggregate Gauge + State Timeline
- **Day 3:** Integration + validation automation
- **Day 4:** PM demo, proof pack finalization

9. Risks & Mitigations

Risk	Mitigation
Scope creep	4-day hard timebox; daily scope check
Misalignment with SOP	Daily PM sync; POC allowances documented
Dev delays	Start with minimal UI (gauge + controls)
Proof ambiguity	Validation checklist must be fully completed

Step 2: Jira Import (Executed)

CSV imported as **KRYL-10 Epic + 6 stories**.

Backlog is now structured, ready for sprint planning.

Step 3: Immediate Action (Today)

1. **Share POC Charter** with PM (Mr. XS) for sign-off (async).
2. **Assign Dev** – if not yet assigned, identify resource.
3. **Start POC-1 (Signal Generator UI)** – can begin immediately while charter is reviewed.
4. **Simulate TAB input** – I'll draft now for KRYL-10 Decision Memo.

Simulated TAB Feedback (KRYL-10)

Michael Nielsen:

"The POC tests the right inference layer—collective recognition as aggregation of weak signals. Ensure decay modeling reflects real-world memory, not just arithmetic."

Bret Victor:

"The visualization must make causality legible: signal → score → threshold → state. If the 'why' isn't visually obvious, the UI fails."

Timnit Gebru:

"POC allowances must be time-bound and explicitly listed. Document what is relaxed now so it can be restored in production."

Patrick Collison:

"Keep the architecture separable—POC code must not contaminate production. Prove the mechanic, not the platform."
