

INTELLECTUAL PROPERTY OVERVIEW

KRYLO

A structural review of the system's architecture and documentation record, prepared for attorney assessment.

August 2026

Founder Background & Why This Matters

Building Complex Systems Across Technology, Enterprise, and Creative Domains

- 20+ years delivering enterprise technology programs across engineering, infrastructure, digital platforms, and AI enablement.
- Autodesk — engineering, build/release, and web systems foundation.
- Royal Caribbean Group — enterprise infrastructure modernization and global digital initiatives.
 - Program Manager for Next Generation Embarkation (NGE).
 - Part of the global team delivering four billion-dollar-class ships.
 - Includes Carnival, a Royal Caribbean Group subsidiary.
- AmEx / regulated enterprise environments — large-scale delivery, governance, and operational complexity.
- Founder-led development approach combining technical execution, product strategy, and creative direction.
- Filed first patent at 14 — a retractable, submersible garden hose.

CORE THEME

Building systems that transform complex information into actionable understanding.

The Origin of KRYLO

The Foundational Observation

Before events become visible, signals already exist.

A vibration.

A pattern.

A relationship.

A change in state.

THE QUESTION

Can we build systems that recognize these signals, understand their relationships, and preserve the path from observation to understanding?

KRYLO began with that pursuit:

Not prediction.

Not persuasion.

Not recommendation.

Recognition of structure before it becomes obvious.

KRYLO Evolution

From Information Verification to Structural Intelligence

INITIAL FOCUS

Understanding information reliability and evidence quality.

REASONING ARCHITECTURE

A staged reasoning pipeline, detailed on the next slide.

CI-F → CI-R → RBCS → LFOS → IB → Decision →
Execution → Feedback → Calibration

CURRENT FOCUS

Detecting relationships, structures, and patterns across complex information environments.

KEY PRINCIPLE *KRYLO is designed to preserve evidence, trace reasoning, and reduce unsupported conclusions.*

Reasoning Architecture

A staged reasoning architecture where each layer performs a distinct analytical function under defined constraints.

COMPONENT	DEFINITION	ROLE IN PIPELINE
CI-F Causal Inference Framework	The signal generation and causal analysis layer that identifies potential relationships, patterns, and contributing factors from available evidence.	Produces candidate causal structures from raw inputs.
CI-R Causal Inference Reasoning	The reasoning validation layer that evaluates whether inferred relationships are logically permissible and consistent with established constraints.	Tests and refines causal hypotheses before downstream processing.
RBCS Reasoning-Based Confidence System	A structured confidence evaluation layer that scores reasoning outputs based on validity, convergence, evidence quality, and supporting factors.	Determines confidence levels without allowing unsupported assumptions to dominate.
LFOS Latent Formation Observation System	The pattern observation layer that detects emerging structures, formations, or relationships developing across signals over time.	Identifies higher-order patterns beyond individual signals.
IB Intelligence Bridge	The transition layer that converts validated analytical structures into usable intelligence artifacts for downstream decision processes.	Connects reasoning outputs to decision and execution workflows.

Current Technical Foundation

Evidence-Based Intelligence Architecture — confirmed implemented capabilities

Multi-Stage Reasoning Pipeline

- Independent processing stages with defined contracts.
- Separation of evidence generation, validation, reasoning, and decision processes.

AS-DIFF

- Canonical comparison framework for heterogeneous information.
- Resolves objects into comparable structures before analysis.
- Tracks unresolved comparison gaps for future refinement.

Formation Detection

- Identifies higher-order structures from underlying signals.
- Supports recognition of patterns beyond individual data points.

Governance Discipline

- Work-order driven development.
- Architectural changes traceable through specifications, implementation, defects, and validation.

Areas Identified for Attorney Assessment

The purpose of this review is not to assert protection, but to identify technical areas requiring professional evaluation.

1 Structural Reasoning & Traceability

POTENTIAL AREA OF REVIEW

- Evidence-backed reasoning paths.
- Derived explanations generated from verified system state.
- Preservation of lineage between evidence, reasoning, and resulting intelligence artifacts.

2 Canonical Comparison Systems

POTENTIAL AREA OF REVIEW

- Comparison of heterogeneous entities through normalized representations.
- Resolution of relationships across different domains.
- Handling of unresolved comparison gaps and refinement opportunities.

3 Decision Integrity Mechanisms

POTENTIAL AREA OF REVIEW

- Non-compensating scoring approaches.
- Separation of validity qualification from downstream confidence scoring.
- Prevention of unsupported inputs being masked by stronger signals.

4 Knowledge Evolution Controls

POTENTIAL AREA OF REVIEW

- Rules governing relationship admission.
- Qualification and escalation workflows.
- Controlled evolution of structured knowledge representations.

Documentation & Development Record

Engineering History and Traceability

MAINTAINED THROUGH

- Technical design specifications
- Product requirement documents
- Investor materials
- Defect records
- High/low-level architecture docs
- Founder documentation
- Jira / work-order history
- Implementation artifacts

Every meaningful architectural change has a documented origin, rationale, implementation path, and validation record.

OBJECTIVE FOR IP REVIEW

Determine the strongest protection strategy across:

- Patent opportunities
- Trade secrets
- Copyrighted materials
- Defensive documentation
